## SPANISH COMITÉ FOR WATER AND DROUGHT

## OBJECTIVE

- The objective of this analysis is to study the consumption of water in the swimming pools in comparison to other water consumption and the optimisation of the water in swimming pools in order to reduce the consumption, as well as the comparison.

## 1-INTRODUCTION

# 1.1. DEFINITION AND HISTORY OF THE SWIMMING POOL 

- At the moment to look for the definition of the word «piscinas (pool)», there are many alternatives and answers that fulfill this word. As just an example and considering only the most significant definitions that we have found are :
- The word piscina comes from latin and is defined as « Pond used for a bath, swim or other excersise and acuatic sport activities»
- Historical evolution of the swimming pools
- A curious fact is that a pool was originally defined as a pond for fish of different types of water, after many years of Christinaity, it was used for the baptism stack.
- However if we want to go back further it has been found images of similar kind of deposits in the Egyptian hyroglyphics inside the pyramids.
- Nowadays, the word pool has found its place as a term related to relaxation, sport, enjoyment and health.

# 1.2.- POSITIVE FUNDAMENTALS FOR USING A POOL 

- Direct generation of employment
- Auxilliary industry that generates products for swimming pools.
- Use for therapeutic treatments and general health.
- Leisure and social activities
- Dse for emergencies and heatwaves

Use $b^{b} l$ the fire service to exstinguish

# 1.3- DEFINITION OF DROUGHT AND ACTUAL TRENDS 

- In general the definition drought is quiet complex; the following are some of the concepts taken from different sources taking into account the multiple interpretations that exist around this definition :
- Prolonged absence, marked deficiency, or poor distribution of the precipitation in a dererminea-place. Period with strong winds, low preqcipitation, high temperatures and usuallystow humidity in the air.
- Each year there are important variations in respect to last years and the drought is not exclusive for the XX and XXI century. In Spain there have previously been severe droughts. As you can see in the next graphics of 2009, the general trends in the map of Spain, it is not very good, however it is not equal in all autonomous Comunities.

## DATOS POR COMUNIDADES AUTONOMAS 3-10-2009

| Region | Capacity | Water reserve |  | Variation |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Andalucía | 10518 | 4028 | (38.30\%) | -19 | (-0.18\%) |
| Aragón | 4326 | 2240 | (51.78\%) | -29 | (-0.67\%) |
| Asturias | 509 | 312 | (61.30\%) | -27 | (-5.30\%) |
| Cantabria | 586 | 366 | (62.46\%) | -7 | (-1.19\%) |
| Castilla y León | 8248 | 3944 | (47.82\%) | -46 | (-0.56\%) |
| Castilla-La Mancha | 5744 | 1286 | (22.39\%) | -3 | (-0.05\%) |
| Cataluña | 1939 | 1257 | (64.83\%) | 7 | (0.36\%) |
| Comunidad de Madrid | 1060 | 610 | (57.55\%) | -12 | (-1.13\%) |
| Comunidad Valenciana | 2461 | 855 | (34.74\%) | -3 | (-0.12\%) |
| Extremadura | 14225 | 5427 | (38.15\%) | 11 | (0.08\%) |
| Galicia | 3220 | 1985 | (61.65\%) | -28 | (-0.87\%) |
| La rioja | 136 | 26 | (19.12\%) | -1 | (-0.74\%) |
| Navarra | 1019 | 271 | (26.59\%) | -7 | (-0.69\%) |
| País Vasco | 244 | 153 | (62.70\%) | -3 | (-1.23\%) |
| Región de Murcia | 137 | 22 | (16.06\%) | 0 | (0.00\%) |

## 2- STUDY OF WATER CONSUMPTION IN SWIMMING POOLS

## EVAPORATION

- Hypothesis starting point:
- Private pool: $8 \times 4 \times 1,5 \mathrm{~m}$.
- Private pool: $8 \times 5 \times 1,5 \mathrm{~m}$.
- Private pool: $9 \times 5 \times 1,5 \mathrm{~m}$.
- Community pool: $12 \times 6 \times 1,5 \mathrm{~m}$.
- Public pool: $20 \times 10 \times 1,75 \mathrm{~m}$.

|  | FAPS | Hispagua | Table MOPT | Article <br> el País | Formel of <br> Visentini |
| :---: | :---: | :---: | :---: | :---: | :---: |
| mm/year | 598,60 | $1.131,50$ | $1.318,00$ | $2.000,00$ | $2.100,00$ |
| (/(day x <br> $\mathrm{m} 2)$ | 1,64 | 3,10 | 3,61 | 5,48 | 5,75 |

## Evaporation Chart of MOPT

|  | Evaporation <br> //day | Evaporation <br> I/month | Evaporation <br> //year | Evaporation <br> m3/year |
| :---: | :---: | :---: | :---: | :---: |
| $8 \times 4 \times 1,5$ | 115,6 | $3.466,5$ | $42.176,0$ | 42,2 |
| $8 \times 5 \times 1,5$ | 144,4 | $4.333,2$ | $52.720,0$ | 52,7 |
| $9 \times 5 \times 1,5$ | 162,5 | $4.874,8$ | $59.310,0$ | 59,3 |

| $20 \times 10 \times 1,75$ | 722,2 | $21.665,8$ | $263.600,0$ | 263,6 |

## Covered Pools

## Evaporation: 4,8l/(day x m2)

|  | Evaporationl <br> l/day | Evaporation <br> I/month | Evaporation <br> l/year | Evaporation <br> m3/year |
| :---: | :---: | :---: | :---: | :---: |
| $8 \times 4 \times 1,5$ | 153,6 | $4.608,0$ | $56.064,0$ | 56,1 |
| $8 \times 5 \times 1,5$ | 192,0 | $5.760,0$ | $70.080,0$ | 70,1 |
| $9 \times 5 \times 1,5$ | 216,0 | $6.480,0$ | $78.840,0$ | 78,8 |
| $12 \times 6 \times 1,5$ | 345,6 | $10.368,0$ | $126.144,0$ | 126,1 |
| $20 \times 10 \times 1,75$ | 960,0 | $28.800,0$ | $350.400,0$ | 350,4 |

## LEAKS

- Hypothesis start point:
- The leaks of a swimming pool are considered a variable, depending on the age of the pool.
- Less than 5 years: 0\%
- Between 5 and10 years: $2 \%$
- More than 10 years: $5 \%$
- Taking into account the facts of the market, we would have an average loss of 2,945\% per year.

|  | Leaks in <br> l/day | Leaks in <br> l/month | Leaks in <br> l/año | Leaks in <br> $\mathrm{m} 3 /$ year |
| :---: | :---: | :---: | :---: | :---: |
| $8 \times 4 \times 1,5$ | 3,9 | 116,2 | $1.413,6$ | 1,4 |
| $8 \times 5 \times 1,5$ | 4,8 | 145,2 | $1.767,0$ | 1,8 |
| $9 \times 5 \times 1,5$ | 5,4 | 163,4 | $1.987,9$ | 2,0 |
| $12 \times 6 \times 1,5$ | 8,7 | 261,4 | $3.180,6$ | 3,2 |
| $20 \times 10 \times 1,75$ | 28,2 | 847,2 | $10.307,5$ | 10,3 |

## BACKWASH

## PRIVATE POOLS

Hypothesis start point :
Recirculation of the whole pool volume : 4 hours

## Backwash every 2 weeks.

Backwash of 5 minutes.

## Pools of continuous use

|  | Backwash <br> l/day | Backwash <br> l/month | Backwash <br> l/year | Backwash <br> $\mathrm{m} 3 /$ year |
| :---: | :---: | :---: | :---: | :---: |
| $8 \times 4 \times 1,5$ | 71,4 | $2.142,9$ | $26.071,4$ | 26,1 |
| $8 \times 5 \times 1,5$ | 89,3 | $2.678,6$ | $32.589,3$ | 32,6 |
| $9 \times 5 \times 1,5$ | 100,4 | $3.013,4$ | $36.662,9$ | 36,7 |
| $12 \times 6 \times 1,5$ | 160,7 | $4.821,4$ | $58.660,7$ | 58,7 |

## Summer Pools (4 months of usage)

|  | Backwash <br> l/day | Backwash <br> l/month | Backwash <br> l/year | Backwash <br> m3/year |

# TOTAL <br> CONSUMPTION(L/day) 5\% RENOVATION PUBLIC SUMMER POOLS WITH EMPTYING 

## CONSUMPTION PER CAPITA

- Hypothesis start point :
- Emptying the pool once a year.
- Private Pool: 5 users. Average consumption of water: 372,48 I/day
- Community Pool: 20 families of 5 members.
- Public Pool: 1.000 users.

|  | Daily water consumption (I/day) |
| :---: | :---: |
| Private Summer Pool | 74,5 |
| Community Summer Pool | 6,2 |
| Públic Summer Pool | 2,2 |

Emptying the pool once every 5 years.

- Private Pool: 5 users. Average consumption of water: 232,64 l/day
- Comunity Pool: 20 families of 5 members.
- Public Pool: 1.000 users.

|  | Daily water consumption per person <br> (//day) |
| :---: | :---: |
| Private Summer Pool | 46,5 |
| Community Summer Pool | 3,8 |
| Públic Summer Pool | 1,4 |
| Public Covered Pool | 2,6 |

## 3.- REPERCUSSION OF THE COST OF THE WATER IN RESPECT TO THE SCOPE OF GLOBAL WATER CONSUMPTION

## 3.1.-Census of Pools

- We have taken into account three studies in order to achieve the most precise census of pools possible :
- National Census of Sport Installations of 2005 realized by The Ministry of Education and Science and the Sports Council.
- Studies realized on the outdoor swimming pools in Barcetona metropolitan area.
- mMarket study realized with Marketaad about private swinaming-pootsin-Spain.

If we transfer these studies and take into account the population of each region of Spain, or the proportion to the public instalations, we can get an approximate number of global swimming pools. With this study together with the market study can determine a quite exact amount.

- According to the study of outdoor pools in the metropolitan area of Barcelona, there are 54.212 pools. If we eliminate the 1.210 public outdoor pools, we get :
- 53.002 private outdoor pools.
- 1.210 public outdoor pools.
- 256 public indoor pools.

At this point we have to continue with the following two hypotheses :

## HYPOTHESIS IN BASE TO THE POPULATION

Calculate the number of pools per Autonomous Comunities in base to the population and taking as reference the 54.468 pools for 5.309 .404 habitants. According to the ratio 0’0102588 pools/ habitant with a total of 44.708 .964 frabitantof $x 0^{\prime} 0102588=458.660$ pools in Spain.

| C. Auto noma | Poblacion | $\mathrm{N}^{\mathrm{o}} \mathrm{p}$ iscinas |
| :---: | :---: | :---: |
| And alucia | 7.975 .672 | 81.821 |
| Aragon | 1.277 .471 | 13.105 |
| Asturias | 1.076 .896 | 11.048 |
| $B$ aleares | 1.001 .062 | 10.270 |
| Canarias | 1.995 .833 | 20.475 |
| Cantabria | 568.091 | 5.828 |

| Navarra | 601.874 | 6.175 |
| Pais Vasco | 2.133 .684 | 21.889 |
| Region de Murcia | 1.370 .306 | 14.058 |
| Total España | 44.708 .964 | 458.660 |

## HYPOTHESIS IN BASE TO THE PROPORTION OF PUBLIC POOLS

Calculating that for each 1.466 public pool ( 1.210 outdoor +256 indoor pools in the metropolitan area of Barcelona) there exists a total of 54.468 public and private pools, it means that in Spain, with a total of 31.686 public pools, we hake a total of 1.177.270 pools.

# BASE PF THE STUDY OF THE MARKET WITH REAL DATA ABOUT PRIVATE SWIMMING POOLS. 

In this section the study has taken into account the existsing homes in Spain, coming to a conclusion that there are 1.112.000 private swimming pools.
To this data it had to be added 23.734 public outdoor pools and the 2.751 public indoor pools reflected in the National Census of Sport Instattations.

## TOTAL PRIVATE AND PUBLIC POOLS IN SPAIN : 1.138.485

As the study in base to the proportion with public pools and the study of the market show a very similar amount, we will continue with this estimation in the future.

## 3.2.- Calculation of the total volume of water in pools

- Public pools: This section is clear and thanks to the National Census of Sport Installations from 2005 where we have a total of 31.686 pools.
- 23.734 outdoor pools with $5.177 .882 \mathrm{~m}^{2}$ of water surface.
- 7.952 indoor pools with a water surface of $620.410 \mathrm{~m}^{2}$..

According to the study, the average depth of the indoor pools are between $1,46 \mathrm{~m}$ and $2,05 \mathrm{~m}$ so we get a result of $5.798 .292 \mathrm{~m} 2 \times 1,75 \mathrm{~m}$ average depth $=10.147 .011$ tah of water, which means 10,15 HMG

- Private pools: Taking into account that the result of private pools are 1.112 .000 and a surface of 43.239 .008 m 2 from the market study and a average depth of $1,5 \mathrm{~m}$, we obtain a total water volume of 64.858 .512 Mah, which means 64,86 HMG.
- The average size of a private pool has been reduced very much in respect to the las study (14×7) :

| Average study | m2 | Dimensions | Percentage | № pools | Total Surface |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Less than 32 M2 | 32 | $8 \times 4$ | $42,70 \%$ | 474.824 | 15.194 .368 |
| Between 32 and 40 M2 | 40 | $8 \times 5$ | $27,90 \%$ | 310.248 | 12.409 .920 |
| Between 40 and 50 M2 | 45 | $9 \times 5$ | $12,80 \%$ | 142.336 | 6.405 .120 |
| Mmore than 50 M2 | 50 | $10 \times 5$ | $16,60 \%$ | 184.592 | 9.229 .600 |
|  |  |  | $100,00 \%$ | 1.112 .000 | 43.239 .008 |

Average surface $44.268 .851 \mathrm{~m} 2 / 1.138 .485$ pools $=$ $38,88 \mathrm{~m} 2$ around $8 \mathrm{~m} \times 5 \mathrm{~m}$

## AVERAGE SIZE OF A PRIVATE POOL IN SPAIN: $38,88 \mathrm{~m} 2 \quad 8 \mathrm{mX} 5 \mathrm{~m}$

## NUMBER OF POOLS IN SPAIN

## 1138485,0

-Public outdoor pools
$\square$ Public indoor pools
-Private pools

## Conclusions

1. The capacity of content of water in all pools is around 64,86 HMG in private pools + 10,15 HMG in public pools, that means, 75,01 HMG.

## CAPACITY OF CONTENT OF WATER <br> IN THE POOLS IN SPAIN: 75,01 Hm2

If the total capacity of content of water according to the Ministry of enviroment is 53.252 HMG in December 2006 we are tatking about 0,1408\%.
But in respect to the content of water from the 6th Octoger 2009 (22.948 HMG) we talk about $0,3268 \%$.

## Conclusions

In clearer examples this means(11.008 HMG from La Cuenca del Tajo) $=0,68 \%$ from la cuenca del Tajo; 1,01 \% from la cuenca del Ebro (7.402 HMG) or respect to the internal cuenca of Cataluña ( 740 HMG ) is $10,14 \%$.
2. Another conclusión to study is how much does the water of pools represent in comparison to the loss of water in the general piping network persyear.

## Conclusions

According to the INE (National Institute of Statistics), the study from 2006 about « Statistics and water indicators» show a loss of $16,7 \%$ in the distribution network, so taking into account that the distributed water is 3.913 HMG, the loss of water is then 653,47 HMG.
This means that filling all the pools in Spain is only $11,48 \%$ of the lost water in the distribution network in one year that on the other hand means that with the loss of water per year we could fill all the pools forivate and public) during 4 years.

THE FILLING OF ALL THE POOLS IN SPAIN IS ONLY 11,48\% OF THE OVERALL LOSSES IN THE DISTRIBUTION NETWORK

## 3913,0

-Total water distributed $\mathrm{Hm}^{3}$
-Loss of water in the distribution net $\mathrm{Hm}^{3}$
-Water to fill pools $\mathrm{Hm}^{3}$

## 3.3.- Consumption of the water in the pools in Spain

### 3.3.1.- Evaporation

## Outdoor Pools:

Following the hypothesis of 1.112 .000 outdoor private pools with a surface of $(8 \times 5)$ total of 43.239 .008 m 2 and another 23.734 public outdoor pools with $5.177 .882 \mathrm{~m}^{2}$.
The consumption through evaporation in outdoor pools with the data of MOPT ( Ministry of Public Works) of 3,61 / day per m 2 , it would be for the 1.135 .734 ousdoof pool ( 48.416 .890 m 2 ) $63,80 \mathrm{Hm}^{3}$.

## Indoor Pools:

Taking into account the hyphothesis of 7.952 indoor pools with a surface of $620.410 \mathrm{~m}^{2}$, the consumption with an average of $4,8 \mathrm{l} /$ day per m 2 , would be $1,09 \mathrm{Hm}^{3}$.

## THE EVAPORATION IN SWIMMING POOLS IS 64,89 Hm3

### 3.3.2.- Backwash Lavados masa filtrante

If we consider the pools as in continuous use, according to the study of the market, around $8 \% \%$ of the private pools and $100 \%$ of the public poots the consumption of water in backwashes is $43.66 \mathrm{Hm}^{3}$

|  | COEFICIENTE | AGUA EMBALSADA | CONSUMO |
| :---: | :---: | :---: | :---: |
| PRVATEPOOL MANTANED THEHOLEYEAR (89\%) | 0,543 | 57,73 | 31,34 |
| PRRVATEPOOL NOT MANTA NED(11\%) | 0,18 | 7,13 | 1,28 |
| PUBLIC POOL MANTANED THEHOLEYEAR (100\%) | 1,0863 | 10,15 | 11,03 |
| TOTAL CONSUMPTIONOFBACKWASH Hm ${ }^{3}$ |  |  | 43,66 |

## THE CONSUMPTION OF WATER IN BACKWASHES OF FILTER MEDIA IS 43,66 Hm3

### 3.3.3.- Water losses

The water loss taking into account the market study of the age of the pools, considering that pools less than 5 years old should not leak, a pool between 5 and 10 years has a leak of $2 \%$ and more than 10 years a leak of $5 \%$ the result is shown in the following chart:

| Age | percentage | Hm3 | estimation water loss | loss in Hm3 |
| :---: | :---: | :---: | :---: | :---: |
| less than 1 year | 4,60\% | 3,45 | 0,00\% | 0,00 |
| 1 to 5 years | 19,30\% | 14,48 | 0,00\% | 0,00 |
| 5 to 10 years | 23,00\% | 17,25 | 2,00\% | 0,35 |
| f) 10 years | 49,70\% | 37,28 | 5,00\% | 1,86 |
| Ekfown | 3,40\% | 2,55 | 2,00\% | 0,05 |
|  | TOTAL LOSSES IN Hm3 |  |  | 2,26 |

THE TOTAL WATER LOSSES THROUGH LEAKS ARE ESTIMATED TO $2,26 \mathrm{Hm} 3$

## Conclusions

|  | Consumption <br> evaporation | Consumption <br> backwashes | Consumption leaks | Total |
| :---: | :---: | :---: | :---: | :---: |
| Public outdoor pool | $6,82 \mathrm{Hm}^{3}$ | $9,84 \mathrm{Hm}^{3}$ | $0,28 \mathrm{Hm}^{3}$ | $16,94 \mathrm{Hm}^{3}$ |
| Public indoor pool | $1,09 \mathrm{Hm}^{3}$ | $1,19 \mathrm{Hm}^{3}$ | $0,03 \mathrm{Hm}^{3}$ | $2.31 \mathrm{Hm}^{3}$ |
| Private outdoor pool | $56,98 \mathrm{Hm}^{3}$ | $32,63 \mathrm{Hm}^{3}$ | $1,95 \mathrm{Hm}^{3}$ | $91,56 \mathrm{Hm}^{3}$ |
| Private indoor pool | Not estimated | Not estimated | Not estimated | $\ldots .$. |
| Totales <br> Consumption | $64,89 \mathrm{Hm}^{3}$ | $43,66 \mathrm{Hm}^{3}$ | $\mathbf{2 , 2 6 \mathrm { Hm } ^ { 3 }}$ | $110,81 \mathrm{Hm}^{3}$ |

The total water consumption in swimming pools in one year is $110,81 \mathrm{Hm}^{3}$ , that means $147,73 \%$ of its total volume.

THE TOTAL WATER CONSUMPTION IN ONE YEAR IS 110,81 Hm3

# GRAPHIC OF WATER CONSUMPTION 

Comparing the $110,81 \mathrm{Hm}^{3}$ of water consumption in pools with the $653,47 \mathrm{Hm}^{3}$ (el $16,96 \%$ of distributed water) lost in the piping network it is insignificant.

THE TOTAL CONSUMPTION OF WATER IN POOLS IS ONLY 16,96\% OF THE TOTAL WATER LOSS THROUGH THE DISTRIBUTION NETWORK

## 3.4.- Consumption per user

The consumption per user is fixed from the INE in 2006 to 160 liters/habitants/day.
The consumption of water in a pool per habitant (44.708.964 habitants) is $110,81 \mathrm{Hm} 3 / 44.708 .964 \mathrm{hab} / 365$ days, means 6,79 liters/habitant /day.

## CONSUMPTION OF WATER PER HABITANT 160 litres/habitant/day CONSUMPTION OF WATER IN POOLS 6,79 litres/habitant/day

## 3.5.- Economical costs

As the consumption in a pool is 6,79 litres/habitant/day, and the average cost of water in Spain is $1,23 € / \mathrm{m} 3$ (average calculated between $0,47 € / \mathrm{m} 3$ in 2005 for $175 \mathrm{~m} 3 /$ year and $1,98 € / \mathrm{m} 3$ in Palma de Mallorca) we get an economical result of $1,23 € / \mathrm{m}^{3} \mathrm{x}$ $2,478 \mathrm{~m}^{3} /$ habitants/year $=3,05 € /$ habitant $/$ year

ECONOMICAL COST OF THE WATER CONSUMED FOR A SWIMMING POOL PER HABITANT $3,05 € /$ YEAR

## 4. OPTIMIZATION TO REDUCE THE CONSUMPTION IN SWIMMING POOLS

- Even if it is proven that the analysis of the water demand of a swimming pool against other activities of the daily life is low, the companies in the sector of the swimming pools should continue working in different directions to optimize the water demand to obtain savings of water in the swimming pools.
- Install pool covers to avoid an elevated percentage of evaporated water on summer nights as well as in the winter.
- Establish autocontrol programs that can optimize the water consumption in backwashes and early diagnosis of water leaks
- Maintain the water in good condition in winter to avoid emptying the pool during several seasons.
- Pechnological changes to recover the water from gackwashs, showers and rain for other appropriate uses.

## THANK YOU
